Data warehouse refers to the process of compiling and organizing data into one common database, whereas data mining refers to the process of extracting useful data from the databases. The data mining process depends on the data compiled in the data warehousing phase to recognize meaningful patterns. A data warehousing is created to support management systems.

[Data Mining vs Data Warehousing - Javatpoint](#)

Data warehousing is the process of pooling all relevant data together, whereas Data mining is the process of analyzing unknown patterns of data. Data warehouses usually store many months or years of data. This is to support historical analysis. Data mining is the use of pattern recognition logic to identify trend within a sample data set.

The data in a data warehouse provides information from the historical point of view. Non-volatile ? Non-volatile means the previous data is not erased when new data is added to it. A data warehouse is kept separate from the operational database and therefore frequent changes in operational database is not reflected in the data warehouse.
