Stanley J. Farlow. Most physical phenomena, whether in the domain of fluid dynamics, electricity, magnetism, mechanics, optics, or heat flow, can be described in general by partial differential equations. Indeed, such equations are crucial to mathematical physics. Although simplifications can be made that reduce these equations to ordinary differential equations, nevertheless the complete description of physical systems resides in the general area of partial differential equations.

Since the values of r are pure imaginary, we know that x1(t) and x2(t) will oscillate with angular frequenciesw1= Im{r1}andw2= Im{r2}, that is, w1= □ k/m,w2= q (k +2K)/m. The positions of the oscillating masses in general contain time dependencies of the form sinw1t, cosw1t, and sinw2t, cosw2t. B6 CHAPTER 6.
