The Good Earth is the product of collaboration between the content rigor provided by Earth Science specialists (McConnell, Steer) and the results of research on learning. The Good Earth has been explicitly designed to be compatible with inquiry-based, active learning in the college classroom. The structural elements of this text will allow the instructor to incorporate these student-centered teaching methods into their Earth Science course. The authors have tested the book ' s content and pedagogy in large Earth Science classes for non-majors that are populated with mostly freshmen. Their experiences show that the materials and methods in The Good Earth can improve students ' learning, increase daily attendance, reduce attrition, and increase students ' enthusiasm in comparison with classes taught following a traditional lecture format. The authors have chosen to emphasize three scientific themes throughout the text: i) scientific literacy; ii) Earth Science and the human experience; and, iii) the science of global change. The discussion of scientific methods is woven into the text throughout. They have included numerous examples of human interaction with the Earth that can serve as entry points for students to appreciate the nature of science. Global change is a theme that is evident in much current Earth Science research so our authors have used global change as a content theme throughout the book.

The Pulitzer Prize –winning, New York Times –bestselling novel about a peasant farmer and his family in early twentieth-century China. Mitch McConnell tells his story in this candid memoir, including what he really thinks about the rivalry between the Senate and the House and his opinions of key US political figures. He explains the real causes of the gridlock that has so many US voters enraged, his efforts to restore the US Senate's dual role as a brake on excess and a tool for national consensus, and what he believes American citizens have a right to expect from Washington.

For over four decades, scientists and engineers from around the world have devoted their lives to the Search for Extraterrestrial Intelligence (SETI). And they have never lost hope of finding the greatest needle in the haystack - a sign from outer space that we are not alone. Now, as a result of a groundbreaking computer program called SETI@-home, millions of ordinary people have joined in the search. SETI@home, designed by UC Berkeley's Space Sciences Laboratory, harnesses the idle and unused processing power of over 2.5 million PCs, in what constitutes the world's largest supercomputer, to analyze and process data collected by the Arecibo Radio Observatory. Searching for signs of life from far-off worlds is the ultimate challenge for radioastronomers, because the science of communication spans so many different fields of study-from biology to astronomy to linguistics and information theory. First, scientists must choose which star systems to search. Then they spend extensive time combing through vast data in search of that one faint signal. But listening for a message is only the starting point of SETI. The real question presents the greater challenge: if we receive a message, how will we communicate with its sender? Rather than speculate about what information we might receive, Beyond Contact discusses how we might carry on complex high-level communication across interstellar distances by building a general purpose language to exchange messages with an intelligent alien race. The book also examines traditional radio (microwave) and laser (optical) wave communication techniques employed by SETI researchers and looks at ways to receive and transmit messages. In addition, it provides an overview of the Drake and Brin equations, as well as the Rare Earth Hypothesis. Through a process of elimination, these theories help determine the number of star systems in the universe that could harbor intelligent life. And they shed light on whether Earth - and the development of life here-is just an aberration or the tip of an iceberg.
