Introducing the guide to inter-process communication in Linux

The setup statements in both the sender and the receiver programs are: `key_t key = ftok (PathName, ProjectId); /* generate key */. int qid = msgget (key, 0666 | IPC_CREAT); /* use key to get queue id */. The ID qid is, in effect, the counterpart of a file descriptor for message queues. Example 5.`

Description. Understanding the concepts of processes and interprocess communications (IPC) is fundamental to developing software for Linux. This book zeroes right in on the key techniques of processes and interprocess communication - from primitive communications to the complexities of sockets. It covers every aspect of UNIX/Linux interprocess communications in sufficient detail to allow experienced programmers to begin writing useful code immediately.

6 Linux Interprocess Communications

There are many ways to share data between two processes in Linux. One of the simplest ways is to use PIPES. In pipes the output of one process is the input of the another.

which allows processes to communicate with each other and synchronize their actions. The communication between these processes can be seen as a method of co-operation between them. Processes can communicate with each other through both: Shared Memory; Message passing

Inter Process Communication (IPC) - GeeksforGeeks

In computer science, inter-process communication or interprocess communication refers specifically to the mechanisms an operating system provides to allow the processes to manage shared data. Typically, applications can use IPC, categorized as clients and servers, where the client requests data and the server

responds to client requests. Many applications are both clients and servers, as commonly seen in distributed computing. IPC is very important to the design process for microkernels and nano

Inter-process communication - Wikipedia
Inter Process Communication (IPC) refers to a mechanism, where the operating systems allow various processes to communicate with each other. This involves synchronizing their actions and managing shared data. This tutorial covers a foundational understanding of IPC. Each of the chapters contain related topics with simple and useful examples.

Inter Process Communication Tutorial - Tutorialspoint
Hall 2003 Paperback Paperback
Interprocess Communication Mechanisms Processes communicate with each other and with the kernel to coordinate their activities. Linux supports a number of Inter-Process Communication (IPC) mechanisms. Signals and pipes are two of them but Linux also supports the System V IPC mechanisms named after the Unix T M release in which they first appeared.

/proc - doc.lagout.org

Communication can also be multi-level such as communication between the parent, the child and the grand-child, etc. Communication is achieved by one process writing into the pipe and other reading from the pipe. To achieve the pipe system call, create two files, one to write into the file and another to read from the file.

Inter Process Communication - Pipes - Tutorialspoint
Inter process communication (IPC) is used for exchanging data between multiple threads in one or more processes or programs. The Processes may be

running on single or multiple computers connected by a network. The full form of IPC is Inter-process communication.

Inter Process Communication (IPC) - Guru99

Shared memory is one of the three interprocess communication (IPC) mechanisms available under Linux and other Unix-like systems. The other two IPC mechanisms are the message queues and semaphores. In case of shared memory, a shared memory segment is created by the kernel and mapped to the data segment of the address space of a requesting process.
