With a focus on how to refine research questions as real world events force deviations from the original research plan, they discuss how to study and monitor program implementation and statistical power analysis. They also explore how to assess the human and material resources that will be needed at different times while conducting an applied research design to facilitate the management of data collection, analysis, and interpretation.

Many very intelligent people don't like dealing with numbers. Similarly, many gifted scientists are not especially interested in studying people and their cultural behaviour. In this book, we argue that being interested in people and their cultures, and helping students and others to use numbers to pursue these interests, are not mutually exclusive. Research methods are becoming an increasingly important requirement for students of all kinds. But many students, particularly those in the humanities, struggle with concepts drawn from the social sciences and find quantitative and statistical information inaccessible and daunting. Nonetheless, such concepts are found in nearly all areas of society, from market research and opinion polls to psychological studies of human behaviour. This book aims to provide a simple guide to the process of conducting research in the humanities, with special reference to media and culture, from the planning stage, through the data gathering, to the analysis and interpretation of results: 'planning it', 'doing it' and 'understanding it'. The book aims to show how students' own choice of research topic can be refined into a manageable

Features: *Based on the authors' practical experience as researchers and teachers and is thus accessible, practical and 'how to'. *Includes students' own work as examples. *Bridges the 'divide' between social science and humanities research methods and will therefore appeal to a broad range of students and teachers.
