Suggested methods for determining the strength of rock ...

The two proposed methods for determining the fracture toughness of rock material both use core specimens. The first method uses a 'chevron bend' specimen with a notch cut perpendicular to the core axis. The specimen rests on two support rollers, and a compressive load is applied to press apart the notch sides, causing transverse splitting of the specimen by crack growth in the unnotched part of the notched cross section during the test.

The International Society for Rock Mechanics has so far developed two standard methods for the determination of static fracture toughness of rock. They used three different core-based specimens and tests were to be performed on a typical laboratory compression or tension load frame. Another method to determine the mode I fracture toughness of rock using semi-circular bend specimen is herein ...
